MINMAX ALGORITHM

Program:

```
def minmax(depth, node_index, maximize_player,
                values, height):
    if depth == height:
        return values[node_index]
    if maximizing_player:
        return max(
            minmax(depth+1, node_index*2, False,
                    values, height)
    else:
        return min(
            minmax(depth+1, node_index*2+1, True
                    value, height)
    values = [3,5,9,12,5,23,23]
    height = 3
    result = minmax(0,0,True, values, height)
    print("optimal value:", result)
```

output:

optimal value: 12
