Implementation of forward chaining

PROGRAM:

```
facts = {'a': True, 'b': True, 'c': False}
ruler = [('d', ['a', 'b']), ('e', ['b', 'c']), ('f', ['d', 'e'])]

def forward_chaining(facts, ruler, goal)
    for rule in ruler:
        head, body = rule
        if head not in inferred and all(fact in
        inferred for fact in body):
            current_inferred.add(head)
            if current_inferred:
        else:
            new_inferred = set()
        return goal in inferred

goal = 'f'
if forward_chaining(facts, ruler, goal):
    print(f"The goal '{goal}' can be achieved.")

else: print(f"The goal '{goal}' cannot be received.")
```

OUTPUT:

The goal 'f' can be achieved

The goal 'e' cannot be achieved

The goal 'd' can be achieved
